Brett,

Apologies for the rudimentary question... But:

At your suggestion, I got Lingon to schedule the script. I'm not entirely sure, though, how to configure this action. Is there a command that should be pasted/typed into the "What" field? I'm guessing it's not enough to simply select the slogger script, correct.

What would be the right syntax of the command?

The path to the script on my Mac is /Applications/Slogger/slogger

Thank you!

Brett — Aug 07, 2012 07:26 am

Assuming you've followed the instructions up to that point, then yes, then the best bet is to use this in the what box:

```
/usr/bin/ruby /Applications/Slogger/slogger
```

The Applications folder isn't the best bet for storing slogger, though. You'd be better off in the long run putting it within your user's home folder somewhere, such as ~/Slogger or ~/Scripts/Slogger (where ~ is your home directory). Just fewer file permissions issues that way, more than anything.
