brett,

working on the authentication integration. i have a standalone method that works just fine in getting the xml formatted response for my protected feed. however, when i copy that code into twitterlogger.rb, slogger throws the error "error getting timeline for @username", runtime error: failure getting a response from twitter" and the res = nil. i think i'm missing a dependency somewhere or not finding the right places to plug in the authentication calls. i'm just not experienced enough with ruby to know the gotchas. is this going to be something you add into the rewrite version you have mentioned? i really love the idea of slogger...
