Nice post. How did you handle mails? Are you using an external api, queues, or do you directly rely on a local postfix installation? Just wondering how you also manage to send as many emails as this without being flagged as spam or not failling to send an email.

CodePlea — Aug 01, 2018 09:51 am

Hi. Good question! I just use exim4. I've been running my own email servers for a number of years, so I don't find it too difficult. I do take care to look at bounces and disable those accounts. I also include a link in each email to disable all alerts. My hope is that people would click that rather than mark it as spam. And of course every email address is verified at signup.
